Tech News:

New CNT device converts heat to electricity.

The batteries that power the ubiquitous devices of modern life, from smart phones and computers to electric cars, are mostly made of materials such as lithium that are toxic, difficult to dispose of and have limited global supplies. Now, researchers at Massachusetts Institute of Technology (MIT) have come up with an alternative system for generating electricity, which harnesses heat and doesn't use metals or toxic materials.

In this a coating of sucrose over a wire made of carbon nano tubes is lit at one end, and burns from that end to the other. As it heats the wire, it drives wave of electrons along with it, thus converting the heat into electricity.

“Live as if you were to die tomorrow. Learn as if you were to live forever.”

—Gandhi
